04 · Execute & Collaborate

> *Audience: team leads, team members, PMs · Time: 30 minutes*
> *Prerequisite: modules 01 & 03 · Screens: Execute group + Strategy & Knowledge*

Learning objectives

Run the daily delivery loop: boards, own tasks, timesheets, the Work Inbox and Focus Planner — plus the collaboration surfaces (docs, boards, proofing, feedback) that keep knowledge in the platform.

---

1. Boards (`#/boards`)

Kanban execution of the plan:

- Columns mirror task status (To Do → In Progress → In Review → Done).
- **Drag a card** between columns — status updates flow to EVM, health and dashboards instantly.
- Cards show owner, project, priority and due date; overdue cards are marked.
- Filter by project, owner or swimlane (assignee/team).

> *The same board engine powers Agile Delivery (`#/agile`) with sprints for teams that prefer sprint cadence over continuous flow.*

2. Resources (`#/resources`)

Capacity management for the PMO:

- Each resource has a capacity (h/week) and current allocation from task assignments.
- The view highlights **over-allocations** (>100% load) — the same hot spots surface on the Executive dashboard.
- Use Planning Lab → Resource leveling for prescriptions on how to rebalance without breaking the critical path.

3. Timesheets (`#/timesheets`) — the fuel line

Timesheets convert effort into cost and earned value. Every downstream number (actual cost, CPI, budget burn, freshness) depends on them.

As a team member:

1. Open Timesheets — the week grid shows your assigned tasks.
2. Enter hours per day; add a note where useful.
3. **Submit** for approval. Your entry locks to edits until returned.

As an approver (PM/PMO):
1. Open the approvals queue — submissions by person and project.
2. Check hours against plan; **approve** or **return with comment**.
3. Approved hours immediately:
- post actual cost (Financials),
- update earned value (EVM),
- refresh data-freshness scores (Integrity),
- fire `TIMESHEET_APPROVED` automations (e.g. notify finance).

> *Training message to repeat: **no timesheets = the platform goes blind.***
> *Freshness rails turn "timesheet hygiene" into a visible, scored KPI.*

4. Work Inbox (`#/inbox`)

The personal action list — the default home for delivery roles:

- Everything awaiting **you**: task assignments, approvals, review requests, gate decisions, mentions.
- Work top-down; each item deep-links to its record.
- Empty inbox = nothing pending on you today.

5. Focus Planner (`#/planner`)

A personal time-blocking view over your tasks and meetings:

- See your week, drag tasks into focus blocks.
- Balances planned effort against capacity so you over-commit consciously.
- Pairs with Timesheets: plan the week on Monday, log it on Friday.

6. Field Operations (`#/field`)

For site/field teams: capture progress, observations and photos against tasks from the field; updates attach to the project record and feed health.

7. Strategy & Knowledge

Screen	Use it for
Docs & Knowledge (`#/docs`)	Policies, SOPs, lessons learned — versioned, searchable from `⌘K`
Message Boards (`#/boards-hub`)	Topic discussions per project/program (async status, decisions)
Proofing & Approvals (`#/proofing`)	Review deliverables with markup; approve/reject with an audit trail
Feedback & Roadmap (`#/feedback`)	Collect ideas, triage into the product/project roadmap

All four are permission-gated and searchable — the point is *tribal knowledge becomes institutional knowledge*.

8. Notifications (`#/notifications`)

Everything the platform pushed at you — mentions, approvals, alert breaches, gate requests. Each notification deep-links to its record; the bell icon shows the unread count.

9. Exercise (15 min) — a day in the life of a team member

1. Log in as `liam@pmct.io` (Technical Lead). Your home is the Work Inbox.
2. Open your assigned tasks; move one on the board to In Progress.
3. Open Timesheets — log 6h today on your task; **submit**.
4. Log in as `pm.sarah@pmct.io` → approve Liam's timesheet.
5. Back as Liam: check the Integrity screen (`#/integrity`) — did the freshness score for your project improve? (Approvals are the #1 freshness driver.)
6. Post a status update on the project's Message Board; `⌘K` to find it again.

Discussion: you just fed cost, EVM, health, freshness and reporting with three clicks. What happens to the executive dashboard tonight?

10. Key takeaways

- Boards and inbox = the daily loop; timesheets = the trust layer beneath every financial and EVM figure.
- Approvals cascade: timesheet → cost → EVM → alerts → automations → dashboards.
- Keep knowledge in Docs/Boards/Proofing so `⌘K` finds it, not your inbox.
